

for impressive
performances

FCT 1000 / 1000A

The new **FAT FCT 1000** slant bed CNC lathe has a heavy duty 60° inclined bed with 70° column. The swing over bed is 1000 mm with distance between centers of 1500, 2500, 3500 or 4500mm. The machine is equipped with a Siemens 840 D SL CNC system with Shopturn application for turning and milling. In standard execution there is a heavy duty spindle with bore of 140 mm on FCT 1000 and 220 mm on FCT 1000A. The machine can be equipped with different hydraulic power chucks. Driven tools are optionally available on standard 12-position toolturret (VDI 60). In combination with the continuous C-axis, the machine can carry out complicated milling, drilling and tapping operations. For working on long boring bars, as a special option, there is available also 9 position tool disc which is working with the standard toolturret. On the disc there are 6 positions of VDI60 (static or driven tools) and 3 positions for tool holders according to DIN69881.

Additional options:

C - axis positioning: the spindle is driven by main motor, with hydraulic brake on spindle, spindle encoder for positioning every position (+/- 0,05°).

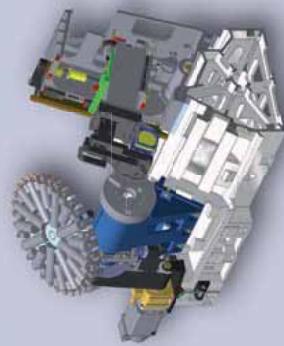

Y - axis - two types possible:
- integrated with machine with stroke ± 200mm,
- integrated with Sauter tool turret with stroke ± 80 mm.

B - axis
The axes are driven with servomotors through ball screw drives, utilizing roller guideways in X and Y axes for high speed movement and slide ways where high stiffness is needed. The ball screws are driven by brushless motor, toothed belt reduction unit and preloaded nuts.

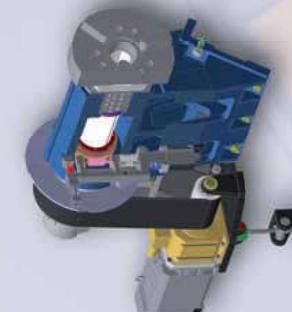

The massive tailstock is positioned with the saddle with hydraulic clamp/unclamp and hook-up operation (hydraulic live quill is standard). Programmable tailstock with separate drive system is an option. The design of tailstock provides also easy setting and high stiffness.

It is possible to install 32 tools magazine powered by B-axis turret and Y-axis column. So equipped machine functions as modern Turning-Milling-Centre.

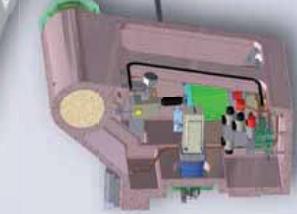

Hydraulic weight compensation of X-axis column for optimum positioning speed and precision.

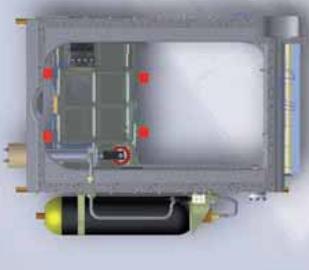

C-axis with Servo-Motor and special wormgear drive enables very high positioning precision and high torque during slow spindle rotation.

Hydraulic self-centering steady rest.
This option is with special independent drive system and can function as CNC axis.

Tailstock can be independently positioned by optional drive.

FCT 700 / 700A

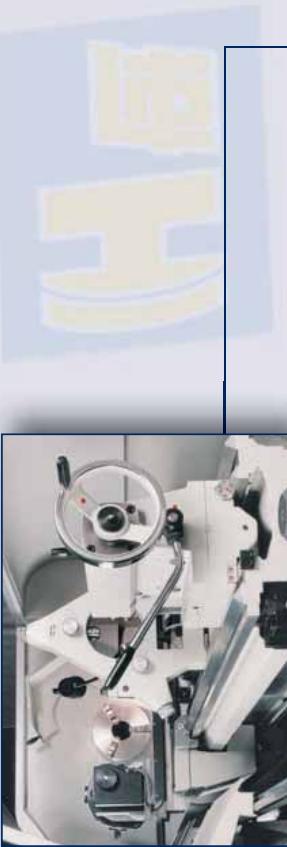

The **FAT FCT 700** lathe is the perfect slant bed lathe for fast, precise and heavy-duty turning and milling of large workpieces. The FCT 700 turning center provides a significant increase in productivity and results in increased profitability. The 70° inclined bed ensures optimum swarf removal, easy setting and inspection of the tools and optimal access to the workpiece for the operator. The FCT 700 lathe is equipped with a 12-station bi-directional tool turret with standard static VDI 50 tooling, which results in lower toolholder costs. Optionally there is available tool turret with driven tools, which in combination with the continuous C-axis enables complicated milling, drilling and tapping operations. The FCT 700 can be optionally equipped with Y-axis (VDI 40) to enable off centre drilling, milling operations and surface milling. Other additional options as measuring system on the X-axis, tool presetter, hydraulic steady rest are possible on demand. Programmable tailstock with hydraulic clamp/unclamp system, built-in live center and automatic positioning (option) provides as well easy setting as bigger workpiece machining.

To achieve a higher torque at lower speeds for heavy machining of big workpieces, the machine can be optionally equipped with an automatic 2-step gearbox.

TUR MN 560 630 / 630A 710 / 710A

The **FAT CNC** lathes in **MN** series meet present requirements for better machining. Easy operation, quick way from drawing to finished workpiece, low maintenance and special features for a modern shop, and much more are available now for very reasonable prices. TUR MN is a manual/CNC high-precision lathe combination. The newest Siemens SINUMERIK 840 D SL Manual Turn control system and AC drives make it most modern production unit for manufacturing very complicated parts made as one-offs or in small batches. When the machine is additionally equipped with such options as hydraulically operated power chuck and tailstock, chip conveyor, live tooling, automatic selection of spindle speed range and electric automatic 8-station turret, it offers efficiency of the most modern flat bed CNC lathe. TUR MN 800 930 1100

[...] The high precision ballscrews for X & Z axis are mounted on high precision bearings to enable sensitive movement. The drive for Z-axis is transmitted to the ballscrew via cogged belt from a Siemens AC servomotor, located on the left-hand side of the machine. After stress relieving treatment and precise machining all bed castings are equipped with hardened guideways which results in a long-life, accurate operation of the lathe. The headstock is also based on a modern compact design. The heavy duty spindle is supported by a combination of double-row cylindrical roller bearings and double-direction angular contact thrust ball bearings - a system which provides the highest precision and rigidity for heavy loads and superior surface finish. [...]

TUR MN 1150 1350 1550

[...] For the longitudinal travel of the saddle in 2m and 4m machines is used a very rigid ball screw of 80mm diameter. The 6m and 8m long machine has a geardrive (pinion with rack) in longitudinal axis.

TUR 1150/1350/1550 MN is equipped with Linear Measuring System in the X-axis as standard. The Linear Positioning System ensures a high positioning accuracy and higher repeatability. The linear measuring system eliminates deviations of position due to expansion of the ball screw because of temperature fluctuations or play between nut and screw any other mechanical play. The heavy-duty tailstock allows bigger workpiece loads and reduces vibration during heavy rough cutting. The extra large 200 mm diameter quill is hardened and has a built-in live centre with MT 6 Taper. The tailstock is on an air cushion for easy movement as standard. The tailstock can be easily positioned by carriage using a quick-released coupling. Hydraulically operated tailstock is offered also as an option.

The **TUR conventional** lathes have been designed for the highly efficient machining of workpieces in unit and serial production. The rigid construction of the machine and the high motor power of 15 kW, the wide range of spindle speeds and high top cutting speeds allow to rationally choose the machining parameters and perform the machining of different materials.

The TUR lathes, owing to their modern solution of the spindles supporting and the application of high-precision angular contact ball bearings, and the TUR 630A/710A as double chuck machines with a bigger spindle bore and spindle supported in special, rigid bearings, allow to achieve the best surface finish. The gears and spindle box made to high-precision standards ensure the accurate operation of the machine tool. The TUR lathes combine a rigid structure with high motor power and a wide range of spindle speeds to enable roughing and finishing all types of steel, cast iron, non-ferrous metals and plastics.

The carriage contains a transmission system which allows a transverse or longitudinal feeding, either manually or mechanically. The rapid mechanical feed can also be used in both directions when the lead screw half nut is disengaged. (The transverse feed is geared to 1/2 the rate of travel of the longitudinal feed.) The headstock contains the main motor, the speed transmission and the feed and thread transmission. The head stock drives the spindle and contains the speed selection transmission which provides a range of 21 spindle speeds.

The main spindle is powered 15 kW motor. The tailstock travels along the two bed sideways. The tailstock is easily positioned by carriage and connection is with a quick-disconnect coupler.

The lathes are capable of cutting right and left-handed threads in all standards: inch, modular and diametrical pitch units.

HACO FAT

FAT, as a member of the Belgian HACO Group, is the leading manufacturer of conventional and CNC lathes in Poland. HACO Group is an important manufacturer of sheet metal working machinery (pressbrakes, guillotine shears, punching machines, laserscutting machines, etc.). For more information please visit www.haco.com.

Since the integration into the HACO Group in 1998, the company has been quickly developing and expanding its products range. In 2001 a modern CNC slant bed lathe and milling machine was released. Its success inspired and brought to life the most modern, with turning diameter 1000mm CNC turning-milling machine.

We have our own independent sales network. About 95% of production is for world-wide export. Our biggest markets are in Western Europe and North America, but we also export to several countries in the Far East, South America, Africa and Australia. Based on more than 50 years experience of lathe production, we are able to construct and execute high quality lathes at very competitive prices.

If You have any questions, we are always for Your disposal.
